1 Convex Envelopes

Definition 1. Let V be a vector space. The functional $g : V \rightarrow \mathbb{R}$ is affine if there exists linear functional $l : V \rightarrow \mathbb{R}$ and $b \in \mathbb{R}$ such that for all $v \in V$,

$$g(v) = l(v) + b$$

Proposition 1. Let V be a vector space. Suppose $f, g : V \rightarrow \mathbb{R}$ are arbitrary functionals. Then,

$$\text{conv}(f) + \text{conv}(g) \leq \text{conv}(f + g).$$

If g is affine, then

$$\text{conv}(f) + \text{conv}(g) = \text{conv}(f + g)$$

Proof. Observe that $\text{conv}(f) + \text{conv}(g)$ is a convex underestimator of $f + g$. Hence, by definition,

$$\text{conv}(f) + \text{conv}(g) \leq \text{conv}(f + g).$$

Suppose g is affine, then both g and $-g$ are convex. Thus, $\text{conv}(g) = g$ and $\text{conv}(-g) = g$. Hence,

$$\text{conv}(f + g) - g = \text{conv}(f + g) + \text{conv}(-g) \leq \text{conv}(f),$$

so

$$\text{conv}(f) + \text{conv}(g) \geq \text{conv}(f + g).$$

Combining this with the first part of the proposition yields the desired equality. \square

Note: Ensure V is a vector space, not a subset of a vector space when applying [proposition 1](#). This ensures V is a convex set, otherwise the domain of f needs to be extended to the convex hull of the set.

2 Separable Additivity of Biconjugates

Definition 2. Let X be some space. The function $f : X \rightarrow [-\infty, \infty]$ is proper if $f(x) \neq -\infty$ for all $x \in X$ and there exists $x \in X$ such that $f(x) < +\infty$.

Definition 3. Let $(X, \langle \cdot, \cdot \rangle)$ be a real Hilbert space. The functional $f : X \rightarrow [-\infty, \infty]$ has a continuous affine minorant if there exists $a \in X$ and $b \in \mathbb{R}$ such that for all $x \in X$:

$$f(x) \geq \langle a, x \rangle + b$$

Lemma 1. Let $(X, \langle \cdot, \cdot \rangle)$ be a real Hilbert space and suppose $f : X \rightarrow [-\infty, \infty]$ is proper and has a continuous affine minorant. Then, both $f^*, f^{**} : X \rightarrow [-\infty, \infty]$ are also proper and have affine minorants.

page 6 - <https://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.23.1198&rep=rep1&type=pdf>

Theorem 1. Let X_1, X_2, \dots, X_n be real Hilbert spaces with inner products $\langle \cdot, \cdot \rangle_{i=1,2,\dots,n}$ respectively and $X = X_1 \times X_2 \times \dots \times X_n$. Suppose $g : X \rightarrow (-\infty, \infty]$ is a proper separable function defined by

$$g(x) = \sum_{i=1}^n g_i(x_i), \quad \text{for any } x = (x_1, x_2, \dots, x_n) \in X,$$

where $g : X := g_i : X_i \rightarrow (-\infty, \infty]$, $i = 1, 2, \dots, n$ are proper functions with continuous affine minorants. Then, g^{**} is proper and for all $x \in X$,

$$g^{**}(x) = \sum_{i=1}^n g_i^{**}(x_i),$$

where g_i^{**} are proper functions.

Proof. Let $x = (x_1, \dots, x_n)$ and $y = (y_1, \dots, y_n)$ be elements of X . Observe that X equipped with the inner product

$$\langle x, y \rangle := \sum_{i=1}^n \langle x_i, y_i \rangle_i$$

defines a Hilbert space. Computing the Fenchel conjugate, we obtain:

$$\begin{aligned} g^*(x^*) &= \sup_{x \in X} \{ \langle x^*, x \rangle - g(x) \} \\ &= \sup_{x_1, x_2, \dots, x_n} \left\{ \sum_{i=1}^n \langle x_i^*, x_i \rangle - g_i(x_i) \right\} \\ &= \sum_{i=1}^n \sup_{x_i \in X_i} \{ \langle x_i^*, x_i \rangle - g_i(x_i) \} \\ &= \sum_{i=1}^n g_i^*(x_i^*) \end{aligned}$$

Observe that g^* is separable and $g_i^* : X_i \rightarrow [-\infty, \infty]$ are proper with continuous affine minorants by 1. Thus, reapplying the above line of reasoning yields

$$g^{**}(x) = \sum_{i=1}^n g_i^{**}(x_i),$$

where again, g_i^{**} are proper by 1. Finally, if g_i , $i = 1, 2, \dots, n$ have continuous affine minorants $\langle a_i, x \rangle + b_i$, then $\langle \sum_{i=1}^n a_i, x \rangle + \sum_{i=1}^n b_i$ is a continuous affine minorant of the proper function g , so g^{**} is proper by 1. \square

Notes:

1. Proof of separability of g^* is adapted from **Proposition 13.30** of Bauschke “Convex analysis and monotone operator theory in Hilbert Spaces.”
2. We allow $\sup = +\infty$ since we are dealing with functions on the extended reals. This also means we do not need to worry about the sets $\{\langle x_i^*, x_i \rangle - g_i(x_i)\}$ being bounded above, hence additivity of the sup should always hold.
